In an exclusive interview, Professor David Nutt, President of the European Brain Council, highlights the need for specialised projects and increased neuroscience funding and research, explaining that the cost of brain disorders exceeds €793 billion a year in Europe alone. Furthermore, describing the life-changing activities implemented by her organisation to provide health and social support, Director of Mental Health Europe, Maria Nyman outlines the interrelation between psychosocial diseases and poverty. Shifting the focus to addiction, Dr Stuart Gitlow, President of the American Society of Addiction Medicine outlines how the Society is supporting research and prevention to improve addiction treatment, raising awareness of the associated dangers, as well as educating healthcare professionals and the public on prevention.

We are working hard to build a dynamic community, bringing together a diverse range of researchers, funders, policy makers and commercial partners to showcase the very best from across the research spectrum. As ever, do not hesitate to contact us with any feedback, registration enquiries or proposals for our next edition. Finally, if you are not already receiving International Innovation, don’t forget to register free of charge at: www.internationalinnovation.com/join-us/registration.

PIONEERING MEDICAL TECHNOLOGIES and increasingly sophisticated treatment and prevention strategies have helped to increase global life expectancy by an average of six years in the last 25 years. Yet, populations worldwide continue to be burdened by the challenges of both infectious and noncommunicable diseases – whether through a lack of available therapeutics, poor awareness of risks, inaccessibility to healthcare facilities or, simply, the absence of a cure.

In this issue of International Innovation, researchers present their latest findings on some of the most prevalent country-specific and international health challenges, including waterborne infections, organ transplantation and cancer. A key target for many health and medical scientists is understanding the brain, an organ known for its intricate mechanisms, which continues to present enigmatic challenges for those endeavouring to develop new treatments for patients affected by complex neurological conditions, addiction, brain tumours and mental health issues.
